STIC-Biotech/ChemLib

68491

Fr m: Sent: To: Subject: Li, Ruixiang Monday, June 10, 2002 4:28 PM STIC-Biotech/ChemLib Sequence search of Application NO: 09/733,387

Please do a standard search on SEQ ID NOs: 43 and 44 against both the commercial and interference nucleic acid database.

Thank you very much!

Ruixiang Li GAU 1646 CM1 10E18 Mail Box 10C01 306-0282

/note="Vector: lambda pSB; Site_1: BamHI; Site_2: ECORI;
First strand cDNA was primed with an anchored
XhoI-oligo(dT) primer [5'GGAGGACGGCGCGCGGAGGGGGT[T)VN
3' 'V=A.C.G: N=A.C.G.T] and then dG tailed. Second strand
was primed with a BamHI-dC primer
[5'AGAGACCTCGGATCCGCACCATAATPATAATC]
Double-stranded cDNA was then digested with BamH1 and XhoI
and directionally cloned into the BamH1 and SalI sites of
lambda pSB vector. Library went through one round of
normalization. Library was constructed by Wel Yu at RIKEN
of Japan (Carninci P. Westover A. Nishiyama Y. Ohsumi T,
Itoh M. Nagaoka S, Sasakin, Okazaki Y, Muramatsu M,
Schneider C, Hayashizaki Y, High efficiency selection of
full-length cDNA by improved biotinylated cap trapper.,
DNA Res 4: 1, 61-6, Feb 28, 1997)"

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is a cDNA encoding human novel G protein coupled receptor (NGPCR). NGPCRs are transmembrane proteins that span the cellular membrane and are involved in signal transduction after ligand blading. NGPCR DNA sequences are useful as hybridisation probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NGPCR can be used to design primers for use in amplification assays to detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NGPCR sequences and/or gene products are useful for identifying compounds that modulate gene products are useful for identifying compounds are useful in the creasion or gene product activity. Such compounds are useful in the creasion or gene product activity. Such compounds are useful in the creasing modulation of disorders related to NGPCR function and diseases. NGPCR DNA sequences and antibodies are useful for diagnostic and for the prognostic evaluation of disorders related to NGPCR function and for the cherapy for modulating NGPCR expression and to produce genetically engineered host cells to express NGPCR products in vivo. The encoded NGPCR proteins are useful for generating antibodies, as reagents in clarance claiming and for diagnostic assays and for identifying other cellular gene products related to NGPCR.
                                                                                                                                    Novel polynucleotides encoding human G protein coupled receptors useful for drug screening, diagnosis and in gene therapy of physiological or behavioral disorders -
                                                                                                                                                                                                                                          Claim 1; Page 84; 91pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     receptor (NGPCR). NGPCRs are transmembrane proteins that span the cellular membrane and are transmembrane proteins that span the cellular membrane and area involved in signal transduction after ligand binding. NGPCR). NGPCRs are useful as hybridisation probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NGPCR gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NGPCR sequences and/or gene product are useful for identifying compounds that modulate gene products are useful for identifying compounds that modulate gene product activity. Such compounds are useful in the treatment of mental, physiological or behavioural disorders and diseases. NGPCR DNA sequences and antibodies are useful for diagnostic and for the prognostic evaluation of disorders related to NGPCR function and for the identification of subjects having a predisposition to such disorders. NGPCR DNA sequences are also useful for druy screening and in gene therapy for modulating NGPCR expression and to produce genetically engineered host cells to express NGPCR products in vivo. The encoded NGPCR proteins are useful for generating antibodies, as reagents in diagnostic assays and for identifying other cellular gene products.

The present sequence is a cDNA encoding human novel G protein coupled receptor (NGPCR). NGPCRs are transmembrane proteins that span the collular membrane and are involved in signal transduction after ligand binding. NGPCR DNA sequences are useful as hybridisation probes for colludar membrane and assessing gene expression patterns. Sequences accening libraries and assessing gene expression patterns. Sequences acception adjacent to the intron/exon boundaries of NGPCR of gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NGPCR sequences and/or gene products are useful for identifying compounds that modulate gene cypression or gene product activity. Such compounds are useful in the transment of mental, physiological or behavioural disorders and diseases. NGPCR DNA sequences and antibodies are useful for diagnostic and for the identification of subjects having a predisposition to such disorders. NGPCR products are also useful for duag screening and in gene therapy for modulating NGPCR expression and to produce genetically engineered host cells to express NGPCR products in vivo. The encoded NGPCR proteins are useful for generating antibodies, as reagents in diagnostic assays and for identifying other cellular gene products.
                          Novel polynucleotides encoding human G protein coupled receptors useful for drug screening, diagnosis and in gene therapy of physiological or behavioral disorders -

The present sequence is a cDNA encoding human novel G protein coupled receptor (NGPCR). NGPCRS are transmembrane proteins that span the cellular membrane and are involved in signal transduction after ligand binding. NGPCR DNA sequences are useful as hybridisation probes for screening ilbraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NGPCR gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NGPCR sequences and/or gene products are useful in the expression or gene product activity. Such compounds that modulate gene expression or gene product activity. Such compounds are useful in the treatment of mental, physiological or behavioural disorders and diseases. NGPCR DNA sequences and antibodies are useful for diagnostic evaluation of disorders related to NGPCR function and for identification of subjects having a predisposition to such disorders. NGPCR DNA sequences are also useful for drug screening and in gene therapy for modulating NGPCR expression and to produce genetically engineered host cells to express NGPCR products in vivo. The encoded NGPCR proteins are useful for generating antibodies, as reagents in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        wovel polynucleotides encoding human G protein coupled receptors usefued drug screening, diagnosis and in gene therapy of physiological or behavioral disorders

NGPCRS are transmembrane proteins that span the cellular membrane and are involved in signal transduction after ligand binding. NGPCR DNA sequences are useful as hybridisation probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NGPCR gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NGPCR sequences and pharmacogenomics. NGPCR sequences and/or gene products are useful for identifying compounds that modulate gene expression or gene product activity. Such compounds are useful in the

treatment of mental, physiological or behavioural disorders and disea NGFCE DNA sequences and antibodies are useful for diagnostic and prognostic evaluation of disorders related to NGPCE function and for identification of subjects having a predisposition to such disorders. NGPCE DNA sequences are also useful for drug screening and in gene therapy for modulating VGECER expression and to produce genetically engineered host cells to express NGPCE products in vivo. The encoded NGPCER proteins are useful for generating antibodies, as reagents in related to NGPCE.

The present sequence is a cDNA encoding human novel G protein coupled receptor (NGPCR). NGPCRs are transmembrane proteins that span the cellular membrane and are involved in signal transduction after ligand binding. NGPCR DNA sequences are useful as hybridisation probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NGPCR gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NGPCR sequences and/or gene products are useful for identifying compounds that modulate gene expression or gene product activity. Such compounds are useful in the exons are also mental, physiological or behavioural disorders and diseases. NGPCR DNA sequences and antibodies are useful for diagnostic and promote and antibodies are useful for diagnostic and procession of disorders related to NGPCR function and for the identification of subjects having a predisposition to such disorders. NGPCR DNA sequences are also useful for drug screening and in gene therapy for modulating NGPCR expression and to produce genetically engineered host cells to express NGPCR products in vivo. The encoded NGPCR proteins are useful for generating antibodies, as reagents in claim of diagnostic assays and for identifying other cellular gene products.
                                                                                                                                                                                                                              upled receptors us

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ω
                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a cDNA encoding human novel G protein coupled receptor (NGPCR). NGPCRs are transmembrane proteins that span the cellular membrane and are involved in signal transduction after ligand binding. NGPCR DNA sequences are useful as hybridisation probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NGPCR gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NGPCR sequences and/or gene products are useful for identifying compounds that modulate gene products are useful for identifying compounds that modulate gene treasment of mental, physiological or behavioural disorders and diseases. NGPCR DNA sequences and antibodies are useful for diagnostic and for the prognession of disorders related to NGPCR function and for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                              useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           identification of subjects having a predisposition to such disorders. NGFCE DNA sequences are also useful for drug screening and in gene therapy for modulating NGPCR expression and to produce genetically engineered host cells to express NGFCR products in vivo. The encoded NGPCR proteins are useful for generating antibodies, as reagents in diagnostic assays and for identifying other cellular gene products related to NGPCR.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a cDNA encoding human novel G protein coupled receptor (NGPCR). NGPCRs are transmembrane proteins that span the cellular membrane and are involved in signal transduction after ligand binding. NGPCR DNA sequences are useful as hybridisation probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NGPCR gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NGPCR sequences and/or gene products are useful for identifying compounds that modulate gene expression or gene product activity. Such compounds are useful in the treatment of mental, physiological or behavioural disorders and diseases. NGPCR DNA sequences and antibodies are useful for diagnostic and prognostic evaluation of disorders related to NGPCR function and for the identification of subjects having a predisposition to such disorders. NGPCR DNA sequences are also useful for drug screening and in gene therapy for modulating NGPCR expression and to produce genetically engineered host cells to express NGPCR produces in vivo. The encoded dispace to make the normal products in vivo. The encoded subject to modulating other cellular gene products in related to more products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel polynucleotides encoding human G protein coupled receptors useful for drug screening, diagnosis and in gene therapy of physiological or behavioral disorders -

MORCR sequences and/or gene products are useful for identifying compounds that modulate gene expression or gene product activity. Such compounds are useful in the treatment of mental, physiological or behavioural disorders and diseases. MORCR DNA sequences and antibodies are useful for diagnostic and prognostic evaluation of disorders related to NGPCR function and for the prognostic evaluation of subjects having a predisposition to such disorders. MORCR DNA sequences are also useful for drug screening and in gene therapy for modulating NGPCR expression and to produce genetically congineered host cells to express NGPCR products in vivo. The encoded diagnostic assays and for identifying other cellular gene products in diagnostic assays and for identifying other cellular gene products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;
                                                                                                                               Novel polynucleotides encoding human G protein coupled receptors useful for drug screening, diagnosis and in gene therapy of physiological or behavioral disorders -
                                                                                                                                                                                                       The present sequence is a cDNA encoding human novel G protein coupled receptor (NGPCR). NGPCRs are transmembrane proteins that span the cellular membrane and are involved in signal transduction after ligand binding. NGPCR DNA sequences are useful as hybridisation probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NGPCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  541

The present sequence is a cDNA encoding human novel G protein coupled receptor (NGPCR). NGPCRs are transmembrane proteins that span the cellular membrane and are involved in signal transduction after ligand binding. NGPCR but sequences are useful as hybridisation probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NGPCR gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NGPCR sequences and/or gene weed in diagnostics and pharmacogenomics. NGPCR sequences and/or gene expression or gene product activity. Such compounds are useful in the treatment of mental, physiological or behavioural disorders and diseases. NGPCR DNA sequences and antibodies are useful for diagnostic and prognostic evaluation of disorders related to NGPCR function and for the identification of subjects having a predisposition to such disorders. NGPCR DNA sequences are also useful for drug screening and in gene therapy for modulating NGPCR expression and to produce genetically and any any and any any any and any and any any and any and any any any any and any any and any any any any any any any any and any any any any any any any any any

```
The present sequence is a cDNA encoding human novel G protein coupled receptor (NGPCR). NGPCRs are transmembrane proteins that span the receptor (NGPCR). NGPCRs are transmembrane proteins that span the receptor (NGPCR). NGPCRs are transmembrane proteins that span the binding. NGPCR DNA sequences are useful as hybridisation probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/corn boundaries of NGPCR gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NGPCR sequences and/or gene products are useful for identifying compounds that modulate gene expression or gene product activity. Such compounds are useful in the treatment of mental, physiological or behavioural disorders and diseases. NGPCR DNA sequences and antibodies are useful for diagnostic and prognostic evaluation of disorders related to NGPCR function and for the identification of subjects having a predisposition to such disorders. NGPCR DNA sequences are also useful for dry screening and in gene therapy for modulating NGPCR expression and to produce genetically no produce serving a predisposition to such disorders considered how to eller and product sin vivo. The encoded nor washed to product sin vivo. The encoded nor product and products in vivo. The encoded nor product and products in vivo. The present sequence is a cDNA encoding human novel G protein coupled receptor (NGPCR). NGPCRs are transmembrane proteins that span the cellular membrane and are involved in signal transduction after ligand binding. NGPCR DNA sequences are useful as hybridisation probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NGPCR gene can be used to design primers for use in amplification assays to

detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NGPCR sequences and/or gene products are useful for identifying compounds that modulate gene expression or gene product activity. Such compounds are useful in the treatment of mental, physiological or behavioural disorders and diseases. NGPCR DNA sequences and antibodies are useful for diagnostic and prognostic evaluation of disorders related to NGPCR function and for the identification of subjects having a predisposition to such disorders. NGPCR DNA sequences are also useful for drug screening and in gene inferrance for modulating NGPCR expression and to produce genetically engineered host cells to express NGPCR products in vivo. The encoded NGPCR proteins are useful for generating antibodies, as reagents in diagnostic assays and for identifying other cellular gene products
                                                                                                                                                                                                                                                                                                                                                                                                               related to NGPCR.

Creening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NGPCR gene can be used to design primers for use in amplification assays to gene can be used to design primers for use in amplification assays to used in diagnostics and pharmacogenomics. NGPCR sequences and/or gene products are useful for identifying compounds that modulate gene product activity. Such compounds are useful in the treatment of mental, physiological or behavioural disorders and diseases. NGPCR DNA sequences and antibodies are useful for diagnostic and compounds are useful for identification of subjects having a predisposition to such disorders. NGPCR DNA sequences are also useful for drug screening and in gene therapy for modulating NGPCR expression and to produce genetically engineered host cells to express NGPCR products in vivo. The encoded NGPCR proteins are useful for generating antibodies, as reagents in diagnostic assays and for identifying other cellular gene products receptor (NGPCR). NGPCRs are transmembrane proteins that span the cellular membrane and are involved in signal transduction after ligand binding. NGPCR DNA sequences are useful as hybridisation probes for present sequence is a cDNA encoding human novel G protein coupled related to NGPCR

Sequence 828 BP; 133 A; 256 C; 234 G; 205 T; 0 other;

Treeptor (NGPCR). NGPCRs are transmembrane proteins that span the cellular membrane and are involved in signal transduction after ligand binding. NGPCR DNA sequences are useful as hybridisation probes for screening libraries and assessing gene expression patterns. Sequences of errived from regions adjacent to the intron/exon boundaries of NGPCR gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NGPCR sequences and/or gene products are useful for identifying compounds that modulate gene expression or gene product activity. Such compounds are useful in the treatment of mental, physiological or behavioural disorders and diseases. NGPCR DNA sequences and antibodies are useful for diagnostic evaluation of disorders related to NGPCR function and for the identification of subjects having a predisposition to such disorders.

NGPCR DNA sequences are also useful for drug screening and in gene therefore the produce geneficially a predisposition or produce geneficially a predisposition and in gene the produce geneficially a predisposition and in gene and a produce geneficially a predisposition and in gene and a produce geneficially programment and a produce geneficially and a produced are also useful for produce geneficially and a produced are also useful for produce geneficially and a produced are also useful for produce geneficially and an analyse and a produced are also useful for produce geneficially and an analyse and a produced are also useful for produce geneficially and an analyse and a produced and a produced and a
